

Search for Words and Word Strings with AGENT RANSACK

Agent Ransack is a fast search utility that lets you search through folders and files for individual words or strings you specify. There are at least two major features that make *Agent Ransack* a much better search engine than is available using Windows search in Windows 10. For one thing, you can specify multiple folder trees that are to be searched. For another thing, the searching is very fast.

Since it remembers your preferences from one session to the next, oftentimes the only thing you'll need to type in is the text you want to find. *Agent Ransack* will then quickly go through the folders and subfolders you've entered (if so indicated), looking for the specified text. In the left pane, it lists the files in which the text occurs. Clicking on a file shows the line(s) in the right pane that contain the text.

If you double-click a file in the left pane, that file will open and you'll have full access to it.

You can also configure *Agent Ransack* to look for regular expressions (either in the file name and/or the search string itself), filter files by size and/or time, and other parameters.

Agent Ransack is a free download available at this site:
