

Artificial Intelligence Copilot comes to Microsoft 365 Accounts

Another shoe has dropped in Microsoft's quest to build generative AI into just about everything.

On March 16, Microsoft announced a new feature named Copilot, which will be provided with Microsoft 365 accounts. Copilot uses generative artificial intelligence, a large language model (LLM), and the Microsoft Graph to provide services based on natural language prompts. Examples of such prompting are evident in the controversial Bing AI, but Microsoft emphasized its commitment to "responsible AI" for Copilot.
