

Create a New Desktop

Although Windows has long supported virtual Desktops (with the help of third-party tools), Microsoft declined to make this feature available to users until Windows 10. Now you can easily create and manage multiple Desktops, which you can use to separate related tasks into their own workspaces. This is useful in environments where you can keep your personal apps and files in one Desktop and your work-related apps and files in another.

To create a new Desktop, follow these steps:

1. Click the Task View button. The Task View appears.
2. Click New Desktop. A new Desktop is created.
3. Click the Desktop that you want to use.
