

LOCK SCREEN AND SIGN-IN SCREEN IN WINDOWS 11

The lock screen appears when you power on or wake up your PC. The version you see in Windows 11 is very similar to that of Windows 10, but it's been updated with the new Windows 11 font treatment.

The Windows 11 lock screen doesn't have any new features, but it is missing one feature from Windows 10: you can no longer configure up to 7 apps that can display quick status alerts. However, you can still configure a single app to display detailed status alerts. There is no workaround.

When you click past the lock screen, Windows 11 will display the Sign-in screen, where you authenticate your account and sign in to Windows. There are no functional changes to this screen.
