

SEARCH IN WINDOWS 11

As with previous Windows versions, Windows 11 features multiple entry points to Search, or what used to be called Start search.

One of the more discoverable is the prominent Search box on the Taskbar, which can be configured to display as a Search icon or Search label or be disabled altogether.

To configure how Search appears in the Taskbar, right-click an empty area of the Taskbar and choose “Taskbar settings” from the context menu that appears.

You can also access Search from Start. When you select the Start icon, the Start pane appears, offering a search box, recent items from Start, and a new feature called Search highlights that displays something interesting related to the current day along with trending web searches you may find interesting.

As with the Search interface in Windows 10, you will find a more traditional Start search-like experience when you begin typing a search term. And as before, you can filter the results to display only apps, documents, web results, or other items.

You can launch Search by pressing WINKEY + S or WINKEY +Q.
